

# **Quantification & scaling of risk factors of diabetes mellitus and isolation of microorganisms from diabetic foot ulcer: a cross sectional study**

**Rinky Sharma**

Roll No. 0119/12

Registration No. 739

Session: 2019-2020

**A thesis submitted in the partial fulfillment of the requirements for the degree of  
Masters in Public Health**

**One Health Institute**

**Chattogram Veterinary and Animal Sciences  
University, Chattogram-4225, Bangladesh**

**January 2021**

## **Authorization**

I hereby declare that I am the sole author of the thesis. I also authorize the Chattogram Veterinary and Animal Sciences University (CVASU) to lend this thesis to other institutions or individuals for the purpose of scholarly research. I further authorize the CVASU to reproduce the thesis by photocopying or by other means, in total or in part, at the request of other institutions or individuals for the purpose of scholarly research.

I, the undersigned, and author of this work, declare that the electronic copy of this thesis provided to the CVASU Library, is an accurate copy of the print thesis submitted, within the limits of the technology available.

## **Acknowledgement**

All praise to Almighty who controls everything according to His will. I am deeply indebted and highly grateful to my respected teacher and supervisor **Prof. Dr. Abdul Ahad**, Dean and Convenor of the Dean Council, Faculty of Veterinary Medicine, Chattogram Veterinary and Animal Sciences University, Chattogram for his constructive criticism and encouragement in every stage of my work like a mentor for excellence. I am also expressing special respect and gratitude to my respected teacher **Prof. Dr. Sharmin Chowdhury**, Director, One Health Institute for her valuable suggestion to complete the thesis work in time with a remarkable quality.

My sincere obeisance to my mother Sumita Sharma and my father Subal Sharma to guide me in a proper way of my life. My special gratitude to Dr. Mohammad Asif Khan, Deputy Civil Surgeon, Chattogram for his cordial guidance, inspiration to peruse carrier in Public Health and for his mentoring to develop networking with public health communities. Furthermore I am also grateful to him due to his valuable opinion to complete the thesis in time.

I am truly thankful to, Deputy Director, Chattogram Diabetic General Hospital, Chattogram; Dr. Shireen Afroz, Consultant, Department of Endocrinology, Chattogram Diabetic General Hospital, Chattogram; Orthopaedic surgeons and other staffs were working in laboratory of Chattogram Diabetic General Hospital, Chattogram for their kind co-operation, sharing their experience and suggestion during the research work. I would like to thank all the Participants participated in this study, in spite of their distress, for their cooperation that made this work possible. I would like to express my gratefulness to all my MPH fellows specially Dr. Jahan Ara for their extended support. I also would like to express my gratefulness to all faculties of One Health Institute, Chattogram Veterinary and Animal Sciences University for their kind efforts.

Last but not the least, I express my sincere admiration to my younger sister Dipta, my elder sister Pinky, elder brother Athanu and friends who have kept me always in line with their continuous company and moral support, also had to suffer a lot during the study period due to my unavailability in their lives.

## Abstract

Diabetes mellitus (DM) is a chronic noncommunicable disease (CNCD) and a leading global health problem. In the last few decades, especially in the developing world, diabetes is the fourth leading cause of deaths. The prevalence of diabetes in Bangladesh is increasing rapidly, as well as complications of chronic diabetes. Diabetic foot is one of the most serious complications associated with diabetes and affects quality of life among patients in all ages and races. The study is aimed at identifying the risk factors & complications of DM and isolate microorganisms from diabetic foot ulcer. In addition, we tried to see the antibiotic sensitivity of the microorganisms along with identifying the antibiotic resistant genes. This is a cross sectional study and was performed among patients of Chattogram Diabetic General Hospital, Chattogram and responses from 106 cases on general and specific variables were documented. Data was collected with predesigned questionnaire along with random blood glucose measurement using glucometer. Sample was taken from diabetic foot ulcer. Microbial culture and CS test was conducted. Out of 106 patients, most were having an age more than 59 years (40; 37.70%) followed by the age group having 55-59 years of age (18; 17.00%) while the lowest number of patients were from the relatively younger age having an age less than 35 years (2; 1.90%). A total of six microorganisms were found in culture. *Staphylococcus* was the most prevalent organism causing the foot ulcers in diabetic patients (28; 26.40%) followed by *coliforms* (16; 15.10%), *Klebsiella* (12; 11.30%), *Enterococcus* (10; 9.40%), *Pseudomonas* and *E. Coli* (8; 7.50%). We have found that gram positive bacteria both *Staphylococcus* and *Enterococcus* 100% sensitive to only Tigecycline among 18 antibiotics alternatively *Enterococcus* showed 100 % resistant to Cefuroxime, Erythromycin and Oxacillin. Among gram negative bacteria, *E. coli* showed 100% sensitive to Colistin, Cefepime, Imipenem, Levofloxacin, Tigecycline in addition *Klebsiella* showed 100% sensitive to Colistin only.

To better understand the risk of the diabetes mellitus and proper management of diabetic foot ulcer the data will be helpful in prescribing appropriate antibiotics, reducing hospital stay, preventing major surgical interventions and thereby saving resources.
