

ACKNOWLEDGEMENTS

At first all of my admiration goes to the supreme creator and ruler of the universe, almighty God, whose mercy keeps me alive and enables me to pursue my education in Fisheries and to complete my thesis for the degree of Master of Science (MS) in Fish Biology and Biotechnology under the Department of Fish Biology and Biotechnology, Chittagong Veterinary and Animal Sciences University (CVASU).

Then I would like to express my heartiest gratitude and sincere appreciation to my honorable teacher and supervisor **Md. Moudud Islam**, Assistant Professor and Head, Department of Fish Biology and Biotechnology, CVASU for his guidance, scholastic advice, useful comment and supervision throughout the whole period of my thesis.

I sincerely express deepest sense of gratitude and indebtedness to our honorable Vice-chancellor **Prof. Dr. Goutam Buddha Das** and **Prof. Dr. Mohammed Nurul Absar Khan**, Dean, Faculty of Fisheries, CVASU for their supportive administrative co-ordination to fulfill my research.

I am greatly indebted and very glad to express my sincere appreciation and profound respect to my honorable teacher **Md. Mahiuddin Zahangir**, Assistant Professor, Department of Fish Biology and Biotechnology, CVASU for his valuable advice, guidance, supervision, suggestions and inspiration during the research work.

I would like to recall with great respect the cordial guidance and support provided by my Co-supervisor, **Joyshri Sarker**, Assistant Professor and Head, Department of Aquaculture, CVASU for his continuous guidance and supervision.

I sincerely thank all technical staffs of Department of Fish Biology and Biotechnology for their help and support during sample collection and laboratory work.

Finally, I am indebted to my beloved parents and friends for their patience and inspiration towards my studies and enormous help to complete my graduation.

ABSTRACT

Unique morphological characters enable better identifications, ensure enhanced perpetuations of resources and management strategies. The landmark-based morphometric and meristic variations in two congeneric hilsa fishes *Tenualosa ilisha* and *Tenualosa toli* were investigated to assess the population status and shape variation within and between the species from three different regions (coastal, riverine and marine) of Bangladeshi waterbodies. All data were adjusted and univariate ANOVA, discriminant function analysis (DFA) and principal component analysis (PCA) showed significant differences in eight morphometric measurements and eight truss network measurements among the three stocks of *Tenualosa ilisha*. For morphometric and landmark measurements, the first discriminant functions (DF) accounted for 89.8% & 87.4% and the second DF resolved 10.2% and 12.6%, respectively of the among group variability and together they explained 100% of the total among group variability. Scattered plotting from PCA and dendrogram from cluster analysis revealed that, the river inhabitants were morphologically different from the coastal and marine populations. This experiment also demonstrated the variability between *Tenualosa ilisha* and *Tenualosa toli* following univariate ANOVA, DFA and PCA. Twelve of fifteen morphometric measurements and thirteen of fourteen truss network measurements showed significant differences between species with significant variation in meristic characters. PCA revealed 89.23% and 88.29% in case of morphometric and truss measurement respectively confirming high degree of variations between the two species. Overall, our results based on morphometrics with truss measurements together provide useful information about the morphological differentiation which will be helpful for sustainable exploration and effective management for these two species.

Key words: Congeneric hilsa fishes, Truss network measurements, Morphometric measurements, Dendrogram
