

Abstract

Fracture due to high rise syndrome is a very common case specially during summer. Sometimes, surgeons need to go through amputation of broken limb. A cat with a history of high rise syndrome was brought to Teaching and Training Pet Hospital and Research Center. After taking x-ray, a complete fracture of left tibial bone was diagnosed. Following primary treatment, the surgical amputation of the affected limb was performed. After a successful surgery, during post-operative care there was a little complication. But with proper guidelines of veterinarians and adequate take care by the owner, now the cat is completely okay and adapted with three legs.

Key words: Amputation, cat, limb, surgery.

Abbreviation and Elaboration

Abbreviation	Elaboration
CVASU	Chattogram Veterinary and Animal Sciences University
TTPHRC	Teaching and Training Pet Hospital and Research Center
DVM	Doctor of Veterinary Medicine
SSC	Secondary School Certificate
HSC	Higher Secondary School Certificate
NSAID	Non-steroidal Anti-Inflammatory Drug
SAID	Steroidal Anti-Inflammatory Drug
BW	Body Weight
IM	Intramuscular
SC	Subcutaneous
IV	Intravenous
