

ACKNOWLEDGEMENT

All sorts of praises go to the Almighty Allah, Who enabled the author to complete this work successfully.

The author wishes heartfelt gratitude to her supervisor **Prof. Dr. Sharmin Chowdhury**, Department of Pathology and Parasitology (DPP), CVASU for her valuable supervision and guidance.

The author gratefully acknowledges all teachers at DPP, CVASU for their valuable provision of information during the research period and also thanks to all the staff of DPP and One Health Institute for their cordial assistance.

The author sincerely thanks **Prof. Himel Barua**, Head, Department of Microbiology and Veterinary Public Health, CVASU for his suggestions and guidance. It's the author's immense pleasure to thank **Dr Tridip Das**, Scientific Officer in Poultry Research and Training Centre, providing support to extend the spectrum of her thesis work.

The author humbly thanks to **Dr. Sirazul Islam, Dr. Chandan Nath, Dr. F. M. Yasir Hasib, Dr. Pronesh Dutta, Dr. Sahidur Rahman, Seemanta Das and Asma Sadia Authoy** for their suggestion, encouragement and support during research work.

The author would like to express her deep sense of gratitude to **Advance Study and Research, CVASU, Bangladesh Agricultural Research Council (BARC) and Ministry of Science and Technology**, People's Republic of Bangladesh for providing necessary research funds.

Finally, the author expresses her thankfulness to her parents, seniors, juniors and well-wishers.

THE AUTHOR

SUMMARY

Antimicrobial resistance (AMR) is known as a silent pandemic; an emerging global public health issue. The problem of AMR is similarly salient and prevalent in animals. From a public health perspective, AMR in dairy cattle can also jeopardize human health by the potential dissemination of AMR pathogens to humans via consumption of infected dairy products or direct contact with infected dairy cattle. Harshly, the dairy industry is increasingly confronted with AMR *Staphylococcus aureus* (*S. aureus*) and *Escherichia coli* (*E. coli*). This study was designed to investigate the multidrug-resistant pattern along with the most frequently isolated resistant genes of *S. aureus* and *E. coli* from bovine milk in the south-eastern part of Bangladesh. A total of 175 samples were randomly collected from ten dairy farms. Isolation and identification of *S. aureus* and *E. coli* were done following the standard bacteriological method. The *spa* gene and 16s rRNA gene were tabbed in molecular identification of *S. aureus* and *E. coli*, respectively. In this study 26 (14.86%; 95% CI 10% - 21%) isolates were confirmed as *S. aureus* whereas 20 (11.43%; 95% CI 7.12% - 17.10%) were confirmed as *E. coli* based on the PCR assay. Among the positive *S. aureus* isolates, 22 (84.6%; 95% CI 65.1%-95.6%) were characterized with the presence of AMR genes and 17 (85%; 95% CI 62.1%-96.8%) *E. coli* isolates were characterized with the presence of AMR genes. Afterward, the positive isolates were screened against 15 antimicrobials using the disc diffusion technique. At a fleeting glance, the highest number of *S. aureus* (80.7%, 95% CI 60.6-93.4) isolates were resistant to streptomycin and all the *S. aureus* (100%) were sensitive to meropenem. Meanwhile, all the *E. coli* isolates were resistant to ciprofloxacin whereas 95% (95% CI 75.1% - 99.9%) showed sensitivity to meropenem and 80% (95% CI 56.3%-94.2%) to gentamicin. Among the 26 *S. aureus*, 5 isolates (19.2%) were positive for the *mecA* gene. *tetK* gene was identified among the 19 (73.1%) *S. aureus* isolates and belonged to the highest proportion. On the other hand, the *tetM* gene was found within the 2 isolates showing the least percentage. In case of *E. coli*, the ciprofloxacin-resistant gene *gyrA*, was identified among the 19 (95%) *E. coli* isolates and it was the highest proportion. No colistin resistant gene was detected in isolated *E. coli*. Fifty percent of the *E. coli* isolates represented sulphamethoxazole-trimethoprim resistant gene *sul1* and *sul2*. Similarly, 10 (50%) *E. coli* isolates were positive to ampicillin resistant gene *blaTEM* and 30% were *blaCTX-M*, resistant to ceftriaxone.

From the univariable logistic regression analysis, it was evident that the odds of having AMR *S. aureus* was 2.41 (95% CI: 0.96-6.07) times higher in the farms where the antibiotic course was not completed properly. Furthermore, the odds of having AMR *E. coli* in bovine raw milk was almost 23 (95% CI: 6.09-84.25; P=<0.0001) times higher in the dairy farms avoiding the practice of antibiotic course completion, 12 (95% CI: 3.31-44.12) times higher where withdrawal period was not followed, 18.38 (95% CI: 4.98-67.82) times attributed when the farms avoided proper dose maintenance and 7.62 (95% CI: 2.10-27.63; P=0.002) times greater in those dairy farms having the farm personnel without the knowledge of AMR. However, multivariable logistic regression model showed no significant association might be due to low observation number. In case of presence of *S. aureus* in the sample, after adjustment of the confounding effect of the factors in the multivariable logistic regression model, a potential risk factor (CMT result) was identified in this study. The odds of the presence of *S. aureus* in the CMT test 'positive' samples was 10.3 times (95% CI: 2.6-40.5) higher than the CMT test 'negative' samples. In the case of *E. coli*, the multivariable analysis showed that the presence of *E. coli* increased by 13.7 times if the floor had been contaminated with mud and cow dung during the milking time and exclusively a hike odds found in case of the dirty udder of cows, as well. Conclusively, the study findings will provide ample statistical evidence to develop strategies for improved antimicrobial stewardship, rejuvenate the antimicrobial drug channel and to develop efficacious and sustainable alternative approaches to tackling AMR crisis both in humans and livestock.
